Thread: [Root to the server : Architecture of a Word! Press](#)

73SLA - January 3, 2024, 11:32 am

I want to know how to bypass WAF, bypass sitemap website, actually how to root a server, automatically detect all htaccess hidden files and folders. More precisely, I want to see the entire structure, the entire architecture of a Word!Press CMS that a certain website has.

Hi,

Wordpress is actually on GitHub. The basic directory tree can be found there:
<https://github.com/wordpress/wordpress>

Coming from the [Wordpress Documentation](#), these are the dependencies:
PHP 7.4 onwards

Non-EOL MySQL or MariaDB

Apache or Nginx with mod_ssl and mod_rewrite

In my experience sysadmins building from scratch bank towards ModSecurity
<https://owasp.org/www-project-modsecurity-core-rule-set/>

Sign up here: /wp-signup.php

Log in here: /wp-login.php

Uploaded files go here: /wp-content/uploads/(year)/(month)/

Semi-important shit go here: /wp-includes/

Cheers!
