Thread: [i wonder about bypass Cloudflare's WAF](#)

C0D3M0N - January 5, 2024, 1:35 pm

hello,

I'm currently trying out sqlmap using sqlmap on a target website using Cloudflare.

For targets that are running on the same source code and do not use Cloudflare, sqlmap runs correctly, but

For those targets using Cloudflare, sqlmap returns HTTP 403.

Does anyone know how to solve this problem or find the REAL IP of that target?

If you can solve the problem I'm having or have a tutorial, I'd like to purchase it.

Thanks.

please PM me :)

you could try using securitytrails and check if there are records where there was no cloudflare running.

i have a cisco merski target that i got level 17 access to following the cge.pl exploit, but when i go to access it i get the cloudflare denied access.

This is a LARGE corporate environment, if i can bypass this im looking at millions.
