Thread: [DIY Anti-detect browser for multi accounts](#)

\$!uo2H%gE# - January 12, 2024, 12:33 am

I need to create a few accounts on the same site and I am curious what is your best setup and how you do it.

Basically what I do is Firefox incognito and that's it.

ComputerScience - January 12, 2024, 4:06 am

If you only need it to register accounts, using incognito + proxy (preferably residential) is enough.

If you need it longterm, then create a browser profile for each account.

Depending on site, there can be some other adjustments to change fingerprint.

Personally, I use docker containers, which each hosts and saves its browser data/profile etc, so it's isolated environments, but that is not usually needed.

After testing some solutions I came across this site, <https://privacytests.org/>. I am quite disappointed in Firefox's fingerprinting resistance tests and since I am not a fan of Brave, I will switch to LibreWolf.

Octo seems like a good solution or any of the browsers in this [list](#).
