Thread: [Cosmic Marai Botnet setup and tutorial | free botnet](#)

Whitedark - January 15, 2024, 5:59 am

Hey I'm Whitedark kinda new to the whole forum thing but I wanted to make a post might help some people out lol.

And before I start frick you guys I tried to do 50 posts so I can post link but fuck didn't work so consider helping me upgrade lol. But for now just copy and paste sorry about that.

And lk skids are probably nutting the self rn but it's better to teach everyone even those retards

So let's start with what kind of botnet is this? This is a version of the Marai botnet which is a IoT botnet that means it uses IoT devices to send the attacks, but I'm guessing most of you knew that lol. All instructions are layer out below ?

Requirements: VPS(recommend crazyrdp), Centos7, A brain

For this you don't need the budget plan get smth a tad faster unless your just fucking broke take a risk and go with [censored] for hosting, it's risky but it's whatever.

Setup vps and connect using MobaXTerm(<https://mobaxterm.mobatek.net/>) that is a safe download from there official site.

Now on your main machine with a nice file gui we can configure the files lmao I'm not trying to do file config in ssh, so get cosmic mirai from (<https://github.com/hoaan1995/Cosmic-Mirai>) this is a trusted version but if you don't trust it or have another that will probably work unless yours is malware you fucking idiot.

Now that you have basic setup here is a video to help you setup the botnet and yea, <https://youtu.be/em6TeJ9zpJA>

Now your probably wondering hey fuck you you didn't teach us to scan frick you man, nah buddy calm down we don't scan because where lazy alr, we steal scan lmfao Alr he is a repo with tons of free scan lists to use, [https://github.com/R00tS3c/DDOS-RootSec/tree/master/Botnets/Vuln%20lists%20\(Mirai%20loader](https://github.com/R00tS3c/DDOS-RootSec/tree/master/Botnets/Vuln%20lists%20(Mirai%20loader)

Alr and if people could please help the retards set shit up without fucking them over I liked this forum in 2015 or 2014 when people actually helped out. And please leave a like of smth to make me happy.

Happy hacking!
Thx for checking it out

DramaKing - January 15, 2024, 6:19 am

Why use a worm from 2016? This seems like it should be more of a historical post than a tut.

Ph4n70M Phr34K - January 28, 2024, 6:46 pm

This doesn't make much sense without 0day exploits or at least not patched ones.

resetti - January 29, 2024, 5:02 am

Bro is yapping about being around in 2014-2015 but is posting a Cosmic Mirai setup

This malware is nearly a decade old bro let it die.

AI63r1ch - April 13, 2024, 3:30 pm

Is a domain name for the botnet not working? If the server is suspended (or worse) you link the new VPS ip address to the domain name and the bots will immediately reconnect?

Camocody - May 24, 2024, 12:37 am

video link doesnt work anymore, is there another one?
