Thread: [how to setup quasar rats \(client wont connect\)](#)

hiyass - February 14, 2024, 1:29 am

hello i have bought an rdp to test out hacking, im using quasar RAT right now just to learn, i am trying to infect my own computer but it is not working,
is there a highly detailed guide on how to setup rats? maybe an ebook? i think that i have follow the quasar rat github tutorial very well, but when i execute my payload on my computer, the quasar panel on my vps/rdp never connects, id appreciate any help, thank you.

I heard that No-IP DNS no longer supports malicious activities like rats if thats what you been using. Have you tried YouTube? There are step-by-step video tutorials there, maybe you can find your answer there. Good luck, my fellow hacker.

Have you made sure that the port is open to the Internet?

check if your port is open(canyouseeme.org)
check if your dns is pointed to your VPS
