Thread: [PHP Website Shell And Worm Scanner](#)

BYTEX - February 16, 2024, 1:00 pm

I usually scan my websites every week for potential attacks and threats. A friend of mine recommended this plugin because my software was fake, and it was adding links to my sites. Through this plugin, I was able to detect and remove malicious code. It really helped me a lot. If you also have unwanted links and codes on your sites, this PHP script will do the job. You just need to upload the file and run it as `site.com/scanner.php`. It's very easy to use; I usually check all the options since malicious codes can be found in most functions.

Hi,

I don't think people would readily trust a publicly-visible PHP file. Also not sure what's stopping you from getting ClamAV and mod_security when you have write access already.

Installing Clamav: `apt install clamav`

Installing Modsecurity:

<https://www.inmotionhosting.com/support/server/apache/install-modsecurity-apache-module/>

Cheers
