Thread: [HELP - Html Structure.](#)

Snoctriz - March 1, 2024, 9:22 am

Greetings,

I was hoping someone could help me just make this image into a html structure. Basically i dont need it to function. I just need you to structure what it looks like from this image to html. This picture is an image of a java chat.

Example:

1. Make it look just like this picture.
2. Don't worry about functionality.
3. Just need something to work off of.

Where do you think you would start with this?

How would you structure it, would there be two boxes, three, four?

I see a div that holds that body, a div that holds the chat container, and a box under the chat container.

There are many ways to structure a project like this for an HTML wireframe. This is not a full layout of the structure, but this will get you closer to your homework.

Code <div id="chat-container">

<div id="header">

<h1>Teen Chat</h1>

</div>

<div id="main-section">

<div id="chat-area">

```
<div id="messages">
</div>
<div id="message-input">
  <input type="text" id="message" placeholder="Type your message here...">
  <button id="send">Send</button>
</div>
</div>
```

```
<div id="sidebar">
  <div id="users">
    <h2>Users</h2>
    <div id="user-list">
    </div>
  </div>
  <div id="rooms">
    <h2>Rooms</h2>
    <p>Lobby</p>
  </div>
</div>
</div>
```

```
<div id="footer">
  <button id="settings">Settings</button>
  <button id="logout">Logout</button>
</div>
```

```
</div>
```

Ohhhh. How are you saving the data?

Snoctriz - March 1, 2024, 2:49 pm

Right now it doesn't save data. I need to configure a database in the backend in order to have it save.

I'm thinking of using MongoDB.

I'm thinking of using MongoDB.
It would be easy to build it with a relational database!
