Thread: [How to use twitter from the command line](#)

Clumsy - March 11, 2024, 11:59 pm

To do this, you will need Linux.

First, visit the following link and create a developer application for your account:

<https://developer.twitter.com/en/portal/dashboard>

After that, install the necessary tools on your Linux terminal or box by following these steps:

Update your system's package list with the command: `sudo apt update`

Install Ruby by executing: `sudo apt install ruby-full`

Install Twurl, a command-line tool for Twitter, using RubyGems: `gem install twurl`

Update your system's package list again: `sudo apt update`

Install Go programming language: `sudo apt install golang-go`

Clone the twttr repository from GitHub: `git clone https://github.com/maaslalani/twttr.git`

Change your current directory to the cloned repository: `cd twttr`

Build the project with Go: `go build`

Move the built twttr binary to your system's local bin directory: `sudo mv twttr /usr/local/bin/`

Authorize Twurl with your Twitter consumer key and secret: `twurl authorize --consumer-key your_consumer_key --consumer-secret your_consumer_secret`

And you're all done!
