Thread: [How to bypass website red-screen?](#)

SIM-5504527 - March 29, 2024, 8:11 am

My website was flagged for spreading malicious software and was red-screened. I removed the download option from the website and requested a review. The red-screen was removed after the review. Now, I want to continue spreading through my website. However, I'm concerned that using the same download button may trigger red-screen and it would delay the review process again.

Is there any way to download software from the website without triggering Google Smart Screen detection?

Background info: I've owned this website since last September, and this is the first time the red screen has appeared.

No such thing as Google Smart Screen. That's Windows Defender. "Red-screened" is a weird way to put it, too. You've been ID'd, pure and simple.

Anyway, I heard people talking about the Red Screen or something like that.

I tried a new downloading method, and my website hasn't been taken down yet so I hope it works (if it has affect at all)
