Yes, of course it still exists. Whether it's still maintained is another story.

https://github.com/miketestz/BitRAT_is_Thief

OH , I think you posting the clean version since it got cracked and source code is leaked
thanks so much buddy
do you have any alternative rat that have the same features of bitrat ?

the bitrat dev sell c# version of bitrat with same features, runtime fud now for private sale.
Old bitrat mass consumer sold is gone.

Can you give me link Please ?
so i can check the features and prices ?
Thanks alot

Thanks alot
only buy from the dev, i hit him up on the same tg that is listed in the about section on the bitrat.

<https://t.me/unkprd>

It works well, but not worth the price imo.

What did happen, could you please explain?

KJTR1 - April 6, 2026, 7:52 pm

(Mar 9, 2026 09:40 AM)Rechnermai Wrote: [\[CITE\]](#) What did happen, could you please explain?The official telegram account for unknown products asked for about \$800 for lifetime and said that they finished the new version of bitrat. I sent the money to them per the requested xmr address. They received it and then never gave me the download for the new version of bitrat. They then deleted their telegram. This was September of 2024

It really sucked. I was the only person interested enough that would have spent time to update it to but the secondary owners that bought it just scammed and ran.

It was a really unique product, the C2C server being self hosted as a TOR site was ingenious for functionality. If you do not need speed but just persistent access it worked pretty great. I tested it legacy on a windows 10 pc fully updated and the protect application function still works to be a system level admin. The devs really slept on a huge financial opportunity for gov clients. A few changes here and there and one could of have a serious nation state project.

To get it running now you need to do the normal cracked installer on a dirt box pc, then swap out the old tor.exe for the new one in the current browser bundle so that the self hosted function works again. Then you want to use this exe swap tool to bind to your stub to change out the exe on the client when it gets installed. (Unless someone wants to be a homie and update the builder tool and update the dependencies in the stub. I asked for help from andmuchmore but he didnt finish it.)

Overall bitrat was fantastic as a product. Wish the devs would come back and make some subtle updates. Likely never will. Wish the original dev would log in on hf and message me back after these years. The uploads on github are so far from actual source code like good luck on fixing that thing.

The upload on github from "mike" and "snyke" aren't real. They were marketing misdirection aimed at pissing off the cracking community and those who thought they could get the product for free.

They had a very aggressive marketing push in which they repeatedly cracked and released competing products for free. (Hive, Venom, Warzone, etc). They also tried to extort those developers behind the scenes (Solmyr, Corruption/firebird) by claiming control of the "market" and demanding a cut of their sales or they "Wouldnt allow them to sell".

This project was not created --by one person-- but a team of 3-4 despite the actual "dev" work. There's alot that went on under the hood of the BitRAT project and if you dig deeper you can uncover just how vicious that team was. They made their bag and ran with it.

Can you tell me more in private? Is there anyway to contact one of the actual bitrat devs still? Im not looking for my money back.

Thats crazy interesting. What did they do? I would imagine backdoor the tool like most tools and a bag run off but was there anything else besides that?

This is bullshit lore.

The developer was the sole actor and people assumed these people were involved when in reality they werent. the bitrat dev went out of his way to pin distribution on other people. hazbot77, majidzhacker, snyke, mike, all of them were nothing but misdirection pawns.

Snyke was a novice reverse engineer learning from krabs. linked to Krabs, snykes activity in the thread was ironically a few days before krabs' first analysis exposing the original dev (revcode and softpatch support is a direct correlation)

Mike was interested in the actual code and is himself an RE

Hazbot77 was some dude who picked up where others left off and began supporting user support for the community, not so much the tool

majidzhacker was the only recognized distributor. b3rap = revcode = unknownproducts this is a fact and it is all over the initial bitrat binaries

remove the "[]" in the "s" in the following url:

[http://web.archive.org/web/20201020180402/https://krab\[s\]onsecurity.com/](http://web.archive.org/web/20201020180402/https://krab[s]onsecurity.com/)

fucking crazy this needs to be explained with all of this fanboy shit over a bloated, upx FORCED build RAT which proved it non viable in the threat landscape

it doesnt even rank historically correctly on trends analysis.

the ssl stub was 1.6mb upx packed which is a total nightmare for crypters???

tor binary was 10mb unpacked and dropped the TOR lib to disk

this was barely considered low class crimeware sold at an inflated price because of fancy gfx

total joke that this is still being talked about
