Need email spoofing any help?

DramaKing - April 3, 2024, 5:28 am

You can try emkei.cz; however, don't expect any of your emails to get through.

fronz101 - April 3, 2024, 10:13 am

Why would you say try if the emails won't come through kind of need to spoof a work email if possible

DramaKing - April 3, 2024, 4:07 pm

Send me the email domain, but you will probably need to send the emails from the designated IP address with the company's signing key, or the recipient's spam filter (if it's any good) will detect that they're spoofed. (Cybersecurity guys are smart). In the case of Gmail, this means no green check mark.

fronz101 - April 4, 2024, 5:10 am

Smartsheet.com is the domain name

Spoofing emails are not reliable in 2024.

most services will see right through it.

You give up and rethink your life choices.

Trying to hack a large software company, huh? Well, if you go [here](#) and look where it says "v=spf1," those are the IP addresses that are permitted senders for emails from the domain. Anything else will be clearly spoofed. As a pro, it doesn't look like you need DKIM.

fronz101 - April 6, 2024, 7:18 pm

Not hacking but copying a format of the email

The Pact - April 20, 2024, 10:41 am

How I'd kind of love to do this but I don't know how.

They're only smart now after years of it being easy and them learning what people do. But I'm only wanting to spoof an email to like an email.

As I told OP, making a copy of an email and altering it is dead simple.

The Pact - April 20, 2024, 1:43 pm

Yeah but the domain of the email would be different right? Actually I don't need to do this. But thanks.

Not to beat a dead horse here, but what I'm saying is that emails can be copied and edited. Nothing more difficult to verify than showing someone an email. Have to show the email in the email client? Just need to learn how to modify the database files to show what you want.
