Any info on what the password is likely to have? IE do you know what the likely language is?

Where are the hashes from? If a website/account, do you know if there are any minimum password requirements? (such as uppercase, lowercase, must be 8 or more characters, needs a special character)

What attempts have you already made if any to crack these hashes?

How certain are you that these are MD5? They seem to be, but are you sure?

In the future you should post this in [Hash Bounties](#) instead of website hacking, ideally offering people something for their efforts if they are successful.
