Thread: [How to monetize a Crypting Algorithm?](#)

Creativo - April 29, 2024, 2:25 pm

Hey guys, So my cousin has a PhD in Mathematics and Cryptography (Dont even know if thats the right name but somewhere along those lines), He created a Cryptography method which has been praised by a lot of Professors here in my country, He has given conferences in Australia, Spain, Las vegas etc...

Anywyas the method is military grade, extremely hard to decrypt if not impossible.

My question is how can we monetize this? Whats the smartest approach? He asked for my help because he is more of an introvert.

Of course I thought about making a crypter and selling it here but I was thinking that might be a bit a waste of time if this is such a good method.

I was thinking of approaching tech companies with it and see how they can benefit from it, tbh I dont know a lot about Cryptography so I dont know how it can be implemented other than Encrypting a file, document, etc...

If anyone could point me in the right direction I would truly appreciate it, and if u need any more info on it let me know, I might release a Crypter here just for the sake of it and see how that goes but I also want to do something bigger with it.

Thanks for taking the time to read.

Making a crypter is not the way to go, a simple XOR is enough, it doesn't matter what encryption method you use as long as the storage & entropy is good.

Also, in the current world of evasion unless you have months of experience with antiviruses, you won't have any long-term success. The ai engine will slap the shit out of you and you will most likely give up, like any of the other 1000's of crypters.

Nobody who has money will want a .NET based crypter simply because of dependencies and the need to target lower OS's such as 7, windows XP.
