Thread: [Who can solve this: How do i prevent a program from detecting a remote desktop on PC](#)

daario - May 8, 2024, 4:19 am

Good pay job; I use a gaming program and the program tries to prevent people from out of state from playing on the platform. I have the program installed on my home PC (in the state) but anytime I'm out of state, I try to connect to my home PC through Remote desktop to play but somehow the program could detect that I'm connecting through Remote desktop and then prevents me from playing. I wish to find a solution to this. How to prevent the program from detecting remote desktop on my home PC Or whoever can build me some kind of private Remote desktop that will be undetectable by any program. Please don't hesitate to contact me with your offer if you can solve this problem for me. [deleted] or PM [warn]

Hi, I can definitely solve this for you, but before you go paying for custom software try these things:

Use teamviewer: <https://www.teamviewer.com/en/>

Use an open source RAT like this: <https://github.com/quasar/Quasar>

Note that I haven't ever used Quasar but it seems to be popular and well known. If the program is just detecting the RDP session one of those should work for you.

DramaKing - May 10, 2024, 6:31 am

So why not use a VPN?

See if your ISP can offer you a static public IP

I have used every type of remote desktop there is, I think the program is more sophisticated in detecting remote desktop. I haven't tried a RAT tho. Do you think RAT uses a different code than remote desktop?

No VPN will ever work and yes my IP is static but that didn't work too.

Skidsuper - May 13, 2024, 1:06 pm

What is this game? It will depend on how it is trying to detect remote desktop.

You would need to use a RAT software. There's also other remote desktop software.

The windows one is on the system by default but there's alternatives.

You can use telnet but that's command only. If you want to see your desktop you have to use the remote desktop protocol.

Or make your own software that uses your own protocol that must be installed on both computers.

Sounds like a creepy game, my friend.
