Thread: [How to spoof sms and email](#)

___3Line - May 15, 2024, 1:06 pm

Anyone can tell about how to spoof sms and email

DramaKing - May 15, 2024, 4:10 pm

(May 15, 2024 01:06 PM)___3Line Wrote: [\[CITE\]](#) Anyone can tell about how to spoof sms and email I know that SMS spoofing of a sort is or was possible. I'd have to research it again, and you could do that, too. Email spoofing used to be possible, but today if you wanted to spoof a known domain, you would have to spoof the IP address of that domain, which is impossible.

chitbox - May 17, 2024, 6:10 pm

Email spoofing requires being able to send spoofed packets if I remember correctly. I do believe there are some resources available. You might have some luck using the search feature here. You may have to check other sources as well, due to this topic is touchy nowadays.

snvk - June 4, 2024, 8:24 am

email spoofing is a technique used in spam and phishing attacks to trick users into thinking a message came from a person or entity they know or trust. In spoofing attacks, the sender forges email headers so that client software displays the fraudulent sender address, which most users take at face value

You can't spoof IP addresses when sending an email. You'd break the connection. At least I think that's your meaning.

Only high-quality, original posts, please. Or you should at least give your source.

actually when you send e-mail you use the domain or api not the ip (no reputable mailbox do that),
so it's very possible to spoof domain if there is misconfiguration in it's SPF or DKIM

best regards

SilentNuke - June 4, 2024, 1:09 pm

It used to be quite easy to spoof email using the PHP mail() function - ive not tried it in a long while, but i believe now, using that method just either sends your email straight to the spam folder, or completely rejected by the mail server.

I have no experience with SMS spoofing. I know there are some scripts on GitHub that claim spoofing and/or bombing but i am unable to verify as i dont live in America and all the scripts i have come across require an American phone number.

IF there's a misconfiguration, don't know if OP has a specific domain in mind.

sure "IF" but i must mention that the chance is very big to find misconfiguration in the target subdomains if the domain don't have this

thisisfoz - June 5, 2024, 6:52 pm

You can use what is known as phpmailer to impersonate email senders, for example.

It is usually used by spammers.

no tool will work with you unless there is problem in domain security policy's

DramaKing - June 5, 2024, 8:05 pm

I get lots of spam/phishing from Gmail or Hotmail or just no-name domains.

Is it some kind of magic exploit tool that bypasses SPF, DMARC, and DKIM checks?

it's not an exploit tool. it's used to send spam and you can fake the sender too.
do some research about phpmailer

I know how email spoofing works. Do you know about email spoofing detection methods?
