Thread: [Anonymously Download Free & Bypass Mega Limit Easily](#)

Skidsuper - May 24, 2024, 9:50 pm

Use a secure VPN service with multiple servers, such as [censored] or IPVanish, as having more servers will yield better results.

Use JDownloader to cache all the MEGA links and start downloading them. Continue until you encounter an out-of-bandwidth or download allocation error (Error 509).

Once you receive the 509 error, disable all downloads (select all files with CTRL+A, then hit the stop button).

Change your VPN server and resume downloading (select all files with CTRL+A, then hit the play button). Repeat this process until the Error 509 goes away.

Note: This method requires you to switch IPs, enhancing your anonymity, privacy, and security while downloading files and bypassing the file limit. Remember, never open any files while connected to the internet unless you are in a virtual machine.

Additional Note: If you use a multi-file hoster downloading account like Premiumize or AllDebrid, ensure you disable premium file downloading in the accounts manager. This is because a Premium Mega subscription already allows unrestricted downloads. If you don't disable it, your download activity could be linked to you through the provider if they keep logs, which most do. If you still choose to go this route, make sure to pay and connect to AllDebrid or Premiumize with a VPN and BTC that isn't traceable. Always run the VPN when downloading files through JDownloader.
