Thread: [bypassing facebook/meta end-to-end encryption on messenger](#)

Hellmaster2234 - June 14, 2024, 5:22 pm

howdy howdy y'all i got a couple of questions, i was wondering how would i go about attempting to bypass facebook's end-to-end encryption, i broke my phone and i had it on there as i was reading up on the end-to-end it says

Quote:"Every device in an end-to-end encrypted conversation has a special key to protect the conversation. When you send a message in an end-to-end encrypted conversation, your device locks the message as it's sending. This message can only be unlocked by a device that has one of the keys for that conversation. No one can access your messages or calls except the people with the keys. You and whoever you're talking to in end-to-end encrypted conversations are the only people with unique, matching keys."

1. does that mean if i could find that special key from both users it would be possible to bypass the encryption
2. how would i go about finding where they would store it and what programs can i use to look for it
- 3 would it be possible to plug the phone it and grab the key from the phone
