Thread: [COMPLETE NOOB looking for help/code](#)

thesaintcalamity - July 2, 2024, 4:02 am

I'm trying to find code that I can send in an SMS or email that doesn't need to be opened or clicked on to automatically install a keylogger and/or all the saved logins on their phone. Is this even possible and if so how do I do it. Like I said I'm a COMPLETE beginner and I'm sorry if I sound stupid or like a rookie or whatever I'm just frustrated with my current search

It's bad to hack other's devices, why do you want to hack someone's iphone ?

Long story it's not for anything nefarious just trying to regain access to my Facebook and the hacker has my email changed to one I have no access to

And you think that a hacker will simply run code from an email attachment or SMS? (Email attachments with executables will be blocked, anyway). And how would you know if the hacker opens a text on a specific mobile OS? Then, too, keyloggers log keystrokes. Keyboards are generally not how people interact with mobile devices.

Contact Facebook. I hear that they're better at responding to reports of compromised accounts. That is your best course of action.
