Thread: [Tails to RDP to residential proxy?](#)

Tails to windows RDP output IP?

Hi there,

I want to configure tails to route to an windows vps/RDP.

From that rdp, I want to then connect to a proxy in a certain location.

Am I right in assuming that the flow is like this?

Tor to RDP and then proxy.

If proxy info is leaked, leads back to RDP IP. If RDP is compromised, ip leads back to tor exit node?

So, boot tails, do business and then whole system is reset when tails is closed?

What are threats that could be used to obtain the origin IP HERE? are there better set ups then this?

It is needed to be able to use websites and stuff but not coming from tor.

Look forward to open discussion on the matter :)

You can connect to a VPS over Tor and then configure it to use a proxy, so you would be routing through Tor, to the proxy, to the VPS, back to the proxy, then to the destination and back. It's going to be quite painful. Your click-to-screen latency will be quite high.

Does residential RDP exist? Or are you referring to a hack home PC that is online and accessible

via the remote desktop protocol?
