Thread: [Maintaining a botnet on a Windows VPS](#)

etizolamvendor - August 3, 2024, 1:04 am

Hello if you're new to maintaining botnets on VPS's there's a couple things to keep in mind while running your net.

Example: You IP has become Blackholed by SPAMHAUS What do I do?

Answer: Purchase a Domain and point a subdomain to the New IP You've gotten from your provider.

Why would you do this? Because you don't want to lose all the Bots.

Maintain a domain by paying the yearly fee to keep it up you do not need to buy hosting when registering use your pseudonym and purchase it from a non-USA domain registrar.

Use Your subdomain and point a dns to your VPS

When creating your Stub, make sure to enable "NO-VM" Cybersecurity Companies like to run virtual machines that are honeypots and report your dns and ip to spamhaus and urlhaus and thats why you get blackholed, so enabling "NO-VM" ensures that your not indexed on any malicious URL lists.

Purchase a VPS from hiddenalps that is maintainable and have a Crypter ready and spread the old fashion way or however you get your Bots.

?if you need help just come over too <https://www.t.me/o7lab>
