Thread: [Chrome warns about file. exe.](#)

josn - August 15, 2024, 7:59 am

My file is pretty decently crypted. But chrome still warns me about "dangerous" file on download, I can ignore and continue without other flags, but it bothers me. Anything I can change in c# code to fix it? Or any other way to encrypt it with winrar in a better way? I don't like passwords.

globalroot - August 15, 2024, 11:43 am

You can buy an EV certificate, or zip the file with a password. It has nothing to do with crypt. Chrome flags less-downloaded executables by itself.

Since zipping is suspicious, I would recommend buying a certificate.

DramaKing - August 15, 2024, 12:02 pm

You will not be able to get an EV certificate, unless you buy a leaked one for \$\$\$\$\$. Those are for drivers, anyway. You should be able to obtain an IV certificate or, at worst, self-sign your file.

Wonder why none mentioned that it also is a name game. I have experimented with random names and on some file names chrome doesn't even bother
