Thread: [\[JustTalk\] Going for AIO \(RAT+Miner \)](#)

pinguoin - August 20, 2024, 8:45 pm

Subject - Intro

- Just looking for the best setup already in the marketplace to save time and the ease of mind, actually, i know that i risk to fall between shit by using, sellers software, but at the same time, it does what i'm looking for the beginning of my work.

- I'd like to know what's your idea about the open-source software i could just edit and try to work around with it, knowing they're might be some exploit around it following me..

; Sure i'd like to make my own, but im not that good to be coding myself a full software, yes i might be able to, but it'll result into some sort of Copy&Paste&Edit...

First

- Just a Quick look to all those awesome works made by some other...

- Yes Awesome sht... But isn't too heavy for c2c ?

- Do i'm just looking into wrong section for a Downl&Exec

Or do you prefer specialized soaps for different cleaning standards?

...

True, but can't he also use a loader, and write plugins to extend it's functionality?

The main payload itself should be small, persistent, stealthy and hopefully native. With regular updates to take care of the download & execute feature (as detections here will fuck up everything, as well as detections on the self-update feature), and some decent plugins I think you got yourself a pretty good "AIO" tool.

And my opinion related to the thread:

Do not use code from open source projects in your tool if you are going to release it in the wild. You can't really "edit" an open source project, you will either spend a lot of time learning the code and in the end changing it completely, or you will get detected at runtime (behavior based detection can catch poorly edited variants of open source techniques as well).

Yes, it takes time to write everything from scratch, but that's the cool part, when you learn new things.
