Thread: [Basic Linux commands to WIFI WEP WPA Dumping Cracking Bluetooth Hacking](#)

WingRust - September 24, 2024, 5:10 pm

Greetings Humans

I've been learning WiFi hacking for the past two years and have been very successful...

Here are my notes on WiFi hacking for WEP/WPA/WPA2, including Bluetooth hacking commands, finding hidden network names, cause we can't hack a hidden network if we don't know the name right, this txt file includes finding vulnerable WPS APs & Routers using Wash, revealing the pin and key using reaver, bully, Oneshot and of course pixiedust, Deauthing APs, Routers or clients (stations) on 2.4 or 5G (note you need an appropriate network adapter), I recommend the Alfa AWUS036ACM with the MT7612U chipset. Capturing handshakes and storing them in a file along with using hcxdump tool, cracking WPA keys with Hashcat, Post connection recon commands using Netdiscover, Nmap, & arp-scan. Injecting packets into a non busy network to save time with arpreplay. Kali update commands to install tools you don't have on your system, saving ESP32 FW to a file then writing it back without knowing any code, running Kismet on a Mac. Some useful tools that you should install if they are not already included with your Kali release and of course some basic Linux commands to get you started navigating your system.

Note these are just notes for my personal use, if you need more info on a switch like -b you can always use the man command or the —help or -h command to find out what the various switches do, although some are explained and others are self explanatory.

Some stuff may be repeated to save scrolling and there are also many ways to do the same thing, so for some specific actions I have included a couple of different ways of performing the same task, like changing mac, putting your device in monitor mode, etc.

If you are missing an app look in the Kali update commands section, although Kali will usually tell you if you try to use an app that's not installed and will also tell you how to install it or even ask if you want Kali to install it for you..

I also recommend Tilix as your Cli as you can split your window into multiples either horizontally or vertically depending on your preference. (Optional)

```
sudo apt update
sudo apt-get install tilix
```

And remember a lot of these commands are just that, they are a reference for my own information, as mentioned some are explained in detail, some are simply the command you enter to perform a specific task, if you are in any doubt whatsoever do not buy, save your bytes, simples...

Finally Enjoy, this has been compiled over the last two years and it's taken me a long time to consolidate all my notes into one file. It's basically an in-depth cheat sheet for WIFI hacking.

Payment is 250 Bytes.

hacker1312 - September 26, 2024, 9:02 am

ty man i realllyyyy like that

bad-algorithm - September 26, 2024, 10:09 pm

I really enjoy wifi hacking and have been doing it in some form or other for many years. Ettercap, Bettercap, SSLstrip I have found are my go to tools to do man in the middle attacks. I have also written a couple of programs I use to pick up a small amount of slack left that these tools don't handle and to streamline grabbing the data. I will take a car and park it with a setup in the back seat. The setup uses 2 laptops that I run as wifi points that people will connect to as they are thinking it's a store or restaurant free wifi. I not only have them connecting to my stuff to serf the web, pay bills, do their banking. While they are busy one of the programs I wrote is connecting to their phone, tablet, laptop or whatever and I am downloading their files real neat and foldered up to view later. By the time they are done with whatever they had to do I own their life. I do this once or twice a week. Park the car and leave it there for a day. All that's left for me to do is search through the data, come up with a price I can sell it for then put it out there to be bid on.

Although it is considered old hat now I enjoy war driving and hack wifi that way. To me wifi hacking is the most fun and most of my wifi hacking is automated and runs on it's own so I head back to my home-base and work from there doing what I do. Loads of fun and had to get caught and people just give you their data pretty much.

WingRust - September 27, 2024, 1:37 am

Sounds like a nice setup [bad-algorithm](#) there's no MITM commands in my cheat sheet though, just general recon and commands to capture and convert PKMID and handshake's using hcxtools to a file usable by hashcat as well as grabbing WPS keys, WEP cracking, finding hidden network names etc. I mainly target local WiFi, not tried mobile yet, I am in a different country at the moment though and as soon as I got here the first thing I thought was, I wish I had bought my laptop and my adapters as I'm right above shops and reading your post and knowing how gullible people are, I really do wish I had packed at least some of my kit, though I doubt my misses would be happy she wants to go to the beech everyday lol. Still I suppose I could have set it up and left it like you do. Yes WiFi hacking is lots of fun, by the sounds of things I still have a way to go to catch you with up though, ettercap, bettercap and Sslstrip are next on my list. I've started on ettercap

My main reason for hacking WiFi is not for financial gain, it is to fuck them up, I am not really interested in what they have on their system to use against them just in the destruction of their digital lives as knowing they have lost their entire catalogue of memories is enough to bring a smile to my face. Maybe you should add a MITM tutorial for bytes, I would buy it. Obviously as you're aware you already need to have gained access to use these attacks, which is what my notes cover, unless of course your using rouge access and captive portals then it's game on as you mention, so shout me up if you add some info for bytes on the stuff you mentioned in your reply, as I said I would buy :D

You must be new to hacking, so I'll leave you a little tip. Don't brag about your crimes. That's what they are, and beyond making some people uncomfortable, you don't want to be overconfident in your OpSec. Besides, this is all highly suspect as it intimates that people do their banking and financial activities over HTTP and hang their files out for anyone on a local network to access.

mobydic1 - September 27, 2024, 3:31 pm

Thanks man seems interesting

WingRust - September 27, 2024, 7:34 pm

Hello [mobydic1](#), and welcome [hacker1312](#) thanks yes I suppose it is quite interesting for me as it's a massive timesaver, not sure how useful it will be for others lol, still I thought I'd put it up anyway. I've seen some right rubbish on sale for bytes and if people can get away with blatant Google copy and paste stuff then I feel mine is well worth the cost.

Wifi Pineapple - September 28, 2024, 4:54 am

(Sep 27, 2024 07:34 PM)WingRust Wrote: [\[CITE\]](#) I've seen some right rubbish on sale for bytes and if people can get away with blatant Google copy and paste stuff then I feel mine is well worth the cost.

Honestly no. The file is 17kb which is tiny. You probably copied some commands then put no additional comments explaining what's happening. I bet it's even just using airmon-ng suite.

It also shows no body wants to pay for it when 0 people have 'purchased' it from you.

bad-algorithm - September 28, 2024, 5:42 am

I have worked with computers since 94. I have written software that I know all of you have used. I have worked with the government in many capacities. Retired recently, and got asked by the NSA, whom I have written software for when I worked for them. I am proficient in 14 programming languages. Been to every country on the planet pretty much many of which are no longer here. Decided to take the NSA up on their offer as long as I don't go to an office and I work on my schedule. I spend a lot of time on the dark web now as I sit here writing code and looking over other peoples code that still works for the government. I am one of the people who have kept you safe so you sleep well. I, for just a little over 30 years could not nor did I ever talk about what I did. No one ever knew. People till this day that knew me still think I was in merchandising and I traveled all the time. Came home one time with 3 bullet holes and a broken right arm once and told people I was robbed and left for dead.

No, I am not giving you grief over comments. I want comments. IF I make people nervous then they should speak up and tell me. I am perfectly fine with that. I don't get intimidated or mad. Damn, I know some of the worst people on the planet. Putin knows my name in English and in Russian. Shook his hand, patted him on the back and smiled. He hates me just as I hate him. I have a letter framed in my hallway that he personally gave me giving me 24 hours to leave Russia. I didn't get mad. I shook his hand, smiled and did a two step laughing. He couldn't touch me and he knew it. I had protection and he hated it. I know many bad people that I have been disinvited from their country. Two weeks ago I was invited to have lunch with the FBI director. Two days ago I took a call from the current CIA chief. I am not bragging. More like stating facts.

I will leave this too the commenters. But my parting words are these. At the moment I plan on staying and do more reading than commenting. But I will still comment on topics. I stopped in this forum because I need a relief one night from real world things going on. Thought and still think this is a hang out. But people should look at the name of this site. Hack Forums. Well I am and have been a real world hacker whom has done bot very good things and very bad things. I am and have been for decades living on both sides of that fence. But most all of it was done with the blessing of various governments. I got tired of being the quiet one in the room. So I began to talk just a little. I

do not have overlords anymore. I am proud to say I am a hacker, patriot, husband and more. Very fulfilled at this point in my life. People come here to talk hacking and make friends. They either want to be like I have been or want to be around people like me. What I mentioned on the WIFI hacking thread was not a thread started by me. I only commented on it. I opined the truth on a thread that I guess someone else opined the truth. Was nothing said to the thread starter. I was given a nickname that I use here as my id by a U.S president that didn't even have the clearance to know my first name or even most of what I did. So he decided to call me Bad Algorithm. He knew enough to come up with that.

Here is my offer. If I make people nervous. They can let me know. Post it, message me, whatever. I am fine with it. I understand it. I make myself nervous when I really think about it. In the mean time, look again at one word that is in the name of this site. Hack, let me say it again, "Hack". Lock me out, ban me, call the authorities, just whatever you want. But if so then the name of this site is a lie. I mean, I don't plan to find real hackers here. Maybe their are one or two. Who knows. Who really knows. We are really hard to find unless we were to speak aloud. Like I have already mentioned. I have been unable to speak for just a tad over 3 years. It feels good to speak out. Would I do this at a dinner party. Not really. Thats a little close to home. Online though. Yes, in a way hiding. I mean ya'll cannot shake me hand, whisper in my ear or ask for a ride home because you had one too many. But online, behind 4 servers around the world that I set up. Using a VPN of sorts that I myself wrote.

If anyone feels odd around me. Message me, post about it. I will get it and be aware more if you message me. I, like I said am fine with it. As for being a beginner. In a way yes, like I said. I just retired. Retired with accommodations, awards, a personally written letter of retirement from 6 CIA chiefs three presidents, four secretaries of state and many others. I am a hacker, a true hacker. I could benefit and add to the community. I have brought something to the table everywhere I go. No hard feeling in the least.

WingRust - September 28, 2024, 8:15 am

(Sep 28, 2024 04:54 AM)Wifi Pineapple Wrote: [\[CITE\]](#) Honestly no. The file is 17kb which is tiny. You probably copied some commands then put no additional comments explaining what's happening. I bet it's even just using airmon-ng suite.

Some of it is airmon-ng yes (honestly what else would it be???), although none of it is copied and pasted I learned and typed those commands myself through hard work and trial and error and they are, as stated in black and white, my notes, some of them are extensively commented and some are just reference commands for myself, there is also other stuff on there like ripping FW from an ESP 32 again not copied, I had to learn how to do it out of necessity and if no one wants to buy it then that's fine, I even put at the bottom if you're in any doubt save your bytes. Simples. If no one buys I don't really care, I have nothing to spend bytes on anyway. If I want to buy something I'll use crypto, I don't gamble, so blackjack and slots are out the window and I've seen nothing I want to purchase. I was gonna put it up for 10 bytes but the site minimum has gone up to 250, not my choice, I might even just paste the whole lot in this thread if there are no takers for a while, or maybe you could buy it and paste it, be my guest. I've even called the file v1 so I can add to it, if and when required. And you cannot deny there are some terrible attachments for sale that are copied and pasted directly from Goggle, you look like you've been here long enough... anyway thanks for clarifying what I've already mentioned that my file is just my own notes nothing more, nothing less and if people want to but then they can make an informed decision based on what I wrote, buy or don't it's their choice, just look at my replies, same thing buy don't buy up to you, anyway, thanks for your input, I look forward to your 250 bytes :D

As I already mentioned in my reply to you, I want to learn that's why I'm hear so I really would be grateful if you can put some of your MITM WIFI knowledge up for byte sale, as I stated already, I will buy, I've seen nothing else that interests me, except your original post, which sounds really interesting and I would love to know how to do all that stuff, you can't keep all that knowledge to

yourself, I'm sure loads of others would be interested too, shout me up as soon as...

Note these are just notes for my personal use, if you need more info on a switch like -b you can always use the man command or the --help or -h command to find out what the various switches do, although some are explained and others are self explanatory.

Some stuff may be repeated to save scrolling and there are also many ways to do the same thing, so for some specific actions I have included a couple of different ways of performing the same task, like changing mac, putting your device in monitor mode, etc.

If you are missing an app look in the Kali update commands section, although Kali will usually tell you if you try to use an app that's not installed and will also tell you how to install it or even ask if you want Kali to install it for you..

I also recommend Tilix as your Cli as you can split your window into multiples either horizontally or vertically depending on your preference. (Optional)

```
sudo apt update
sudo apt-get install tilix
```

And remember a lot of these commands are just that, they are a reference for my own information, as mentioned some are explained in detail, some are simply the command you enter to perform a specific task, if you are in any doubt whatsoever do not buy, save your bytes, simples...

Finally Enjoy, this has been compiled over the last two years and it's taken me a long time to consolidate all my notes into one file. It's basically an in-depth cheat sheet for WIFI hacking.

Payment is 250 Bytes.
ty man appreciate it
