Thread: [How to trace a mobile phones location with only the phone number?](#)

NuMberOne - September 26, 2024, 6:08 am

Hi community have a nice day!

This just FOR learning AND TAKE ME TIME so May Show Me some LOVE and Popularity!

In this tutorial, we will teach you how to track a mobile phone location with just a phone number. It is not exactly that hard to trace someone's location But first, what do you need?

Before we go! Must Read This First:

Quote:I need to warn you: tracing someone's mobile phone without their permission is illegal, and could land you in jail. We, take no responsibility for your actions. We assume you're using this knowledge for the good of humanity.

This is what we assume about your intentions of learning this technique:

Imagine you're in love with someone who is kidnapped by your arch-nemesis/villain of your story. The police refuse to help you because they are crooked and is turning a blind eye to the villain. The only way to get your lost love back is by tracing the location of her phone number.

Don't worry, man! You will get your lost love back. We will teach you how to trace a mobile phone location with just a phone number.

What do you need to get started?

- 1- A laptop or a computer
- 2- An internet connection
- 3- Kali Linux OS

Kali Linux OS

TrackUrl pen-testing tool

Follow these steps to find the location of any mobile phone:

Step #1: Boot into Kali Linux in your computer or Virtual box

Open kali linux

Kali Linux is a Debian-based Linux operating system designed for security and pen-testing tools. If you don't have Kali Linux, download and install Kali Linux OS . Or you can install a virtual machine on your computer with VirtualBox Kali Linux.

Step #2:

Download install TrackUrl From GitHub

TrackUrl is a pen-testing tool made by Z_Hacker. It gives the location of the mobile phone where the link is opened.

Download TrackUrl from GitHub

Either type or copy-paste this code in the terminal to download the files from GitHub

git clone <https://github.com/cryptomarauder/TrackUrl.git>

Copy-paste this code in the Kali Terminal to make the folder available to public

Copy-paste the following code to change the directory in the kali terminal

Step #3: Run the TrackUrl tool in Kali Linux

The next step is run the TrackUrl tool; the application starts running. It will generate an URL and redirects to the local folder of your computer. The window ngrok gives you necessary information. When someone visits this URL, the location and other browser data is pinged back to you.

Step #4: Copy-paste or type the HTTPS URL to terminal

Before you send the URL to the mobile you want to track, you need to open the output stream of the URL. Copy-paste the HTTPS link to display the information the link is gathering.

Display the output stream by copy-pasting the url to the terminal

Press enter you input the URL.

Press enter you type in the HTTPS URL. After you press enter, the terminal will open a new window that displays the output stream.

Track the location in the "tail" terminal window; The "tail" window displays the location but it will be empty since you haven't sent it to anyone.

Done!

DramaKing - September 26, 2024, 6:19 am

This script doesn't actually need Kali Linux. Any Linux OS and probably macOS would do. And I don't think that a kidnap victim will be able to open a link and click on the location permission popup. Anyone hoping for a zero-click method or something more stealthy will be disappointed. Beyond the disclaimer, the other person should already want to send his/her location, making the usefulness kind of eh....

The King Is Here - September 27, 2024, 8:39 am

Finding someone's location by phone number has never been that easy. Nowadays, countless methods exist to help you. Initially, people look out for free methods for location tracking. However, free methods are ineffective and do not provide the best data.

your tutorial describe resource app such as Geofinder mobi tool. always need the person accept to share location.

?Rednix™ - September 28, 2024, 6:54 am

I have used this type of method myself previously for testing purposes, and it can be done much more simpler. I used a Github project, did the setup which was very simple, and sent the link to my spare Android. It will pop up "Allow/Block Location Sharing", so this one will work only on people that are not too smart.

PS. The tool I used also captured front camera picture in addition to location, basically the "victims" face :))

Haangruu - September 28, 2024, 8:18 am

i think this metode can be called by phising ?

yeah I think You are right in now days all people are smart they read that pop on websites allow you location access and then they denied that so we need to find some more other ways.

mrwolf09 - *October 5, 2024, 7:26 am*

I think this is not the method which will be suited for the situation
