Thread: [experienced JS dev Needed \(Local storage\) \[200\\$\]](#)

--Alexander-- - October 5, 2024, 2:30 am

I need someone to create me a JS script that would tinker local storage created in Shopify website ...

A client of mine have a Shopify website and i am facing a limitation with checkout process...

The thing is that for some reason Shopify would send the user to the address step in checkout every time even if he already had a valid address ...
i need to create a JS script that would make the user browser skip the address step in checkout...

I already did some digging and found out that the Shopify stores the checkout progress in a variable in the browser local storage ...

So i need to make a script that would create that variable before checkout so when the user go to checkout it would skip the address step (as the variable already show that it is done...)

Address step that i want to skip

<https://prnt.sc/eiiNtODloiAd>

Local storage thing..

<https://prnt.sc/geXhsme8mAbu>

Note: Please only PM if you are proficient in JS and think that you can complete the job ...

Note2: This is not a standard JS task, this needs out of the box thinking to figure a way to bypass that Shopify limitation
