Thread: [Best mining pool?](#)

timmi888 - October 13, 2024, 11:13 am

I keep trying 2miners with unams miner but i cant seem to get any hashrate been trying for days, loaded on multiple computers and i see the miner working but no hashrate. Can someone suggest a good pool?

If you're failing to get a hash-rate, chances are that your miner is misconfigured. Are you sure you've set everything up correctly? I've used 2miners for mining plenty, and never had any issues mining RVN, XMR, etc. It's always worked fine for me

Also, are you sure you're using the actual, legit SilentCryptoMiner? It's very possible you could be using a backdoored version that just mines to another preconfigured wallet address instead of yours, lol

us-rvn.2miners.com:6060 then i put my wallet address in the othe other part below and i leave the password place empty

what configs do you use because im not quite sure what else i can do here i did leave idle mining on could that be it?

I believe the issue lies in the port you're using. My configuration used the following:
rvn.2miners.com:16060. I believe Unam's miner suggests using the SSL port rather than the regular, not particularly sure why but that's what worked for me. In my case, 16060 was the correct port and I believe it'll apply the same to you.

The comment UnamSanctam made on an issue on one of his other repositories?

UnamSanctam is the only real developer, all the other Github accounts and repositories are fake

This is the official post, includes links to some example configurations also

well at this point i dont even know now, would you be kind enough the share the miner if you have it? maybe i did download a bootleg one

oh nvm i see the link thx will try that one

Yeah try that. Additionally, try using the SSL port rather than the regular one. I think that might be the main issue
