Hello,

You can run Kali on Android ? I've heard that for the next Android version (16) we'll be able to run Linux apps, and also go through virtualization from the phone, but how did you proceed to run Kali on Android ?

Could you share some screenshots ? Could you share some of the error messages too ?

You obviously mean Nethunter, right? If you received errors, why didn't you list them? It's customary when asking for online tech help. Also, where did you download Termux from?
