Thread: [Dynamic DNS for SpyNote and SpyMax](#)

zelus - October 20, 2024, 3:30 am

I have a Question.

Is is possible to set up Spynote and Spymax connections with only Dynamic DNS like noip?

There is no way to remove the port no.

I tried testing the connection but it don't work.

Whats the solution?

Note: I have not tested it with an RDP with Open ports because i prefer using dynamic dns for RATs.

Remove the port no? And what do you mean that you haven't tested it with open ports? Are you expecting that No-IP is an anonymous tunneling service? Since No-IP can detect your malicious usage, I wouldn't even use a domain name. Just use the public IP address for testing, although you will need a bulletproof VPS to avoid jail time.

Get a cheap domain + bulletproof VPS and host ur Rats on it and use the domain as a dynamic dns

Unless you are into mass spreading, you do not really need a BP vps
