Thread: [RAT help, CLeint not connecting](#)

**Backpack-Rucksack** - October 24, 2024, 1:49 pm

all problems solved.

**Ivanov\_1** - October 24, 2024, 2:37 pm

Besides the open port have you enabled the port forwarding rule in the firewall? It has been the case in one of my windows pc, where i opened the port in the router but had to enable the port connecting rule in the firewall, both incoming/outgoing.

It has been the case in one of my windows pc, where i opened the port in the router but had to enable the port connecting rule in the firewall, both incoming/outgoing. Do I have to do that if I have disabled the windows firewall completely?

(Oct 24, 2024 01:49 PM)Backpack-Rucksack Wrote: [\[CITE\]](#) I opened the specific ports and checked on canyouseeme.org and it is open. But whenever I build a stub with either quazar or xeno Rat and run it on a client I am not getting any incoming connection, I really don't know why, please someone help me !

Whoever helps me make the client successfully connect gets a 10\$ paypal payment.

Payment really isn't necessary. Anyway, the issue must be client-side. You are running the payload on a remote network, yes?

I am running in on my own local network at home.

I figured out that the VPN with port forwarding I was using caused the problems. I tested it now without the vpn and it worked.

Thanks to all for helping me.

That would have been really helpful to know. I asked because often trying to connect to your own public IP address is like trying to dial your own phone number. I remember reading once that it may work, but it shouldn't.
