I've seen some keyloggers tutorials on YouTube that don't look really difficult, however it also depends on the functionalities you implement, such as sending to a Discord server, tg, and so on

well i have seen those to + some more tutorials so i can assemble them into one advanced keylogger. i mainly code on python + c# + html.

and in terms of sending info i thought using a private email but discord bots + tg bots can be also usefull i know how to use them in python.

Python is a good way to start in malware development there are some useful librairies that you should take a look at, such as socket for network connections
