Thread: [TEMU APP | HIDDING ROOT/EMULATOR DETECTION](#)

noneman - November 5, 2024, 1:21 pm

Hi, I need help with the following subject!:

At Temu you can get a 30% discount on your order when you download the app to your phone for the first time or you can even earn credits by sharing register invite links.

The weird thing about the Temu app is, when you reinstall it or even reset your phone and download the app again, it still recognizes you. Creating a new account and using a different IP address won't do the trick. So I was thinking that Temu was saving something like a specific ID from my device. I rooted my Samsung phone to be able to change some details.

When I try to use the discount on a phone where I already downloaded the app, I get a pop up saying "The coupon is only available for users downloaded the app in 24 hours". And when I use it on my rooted phone I get a pop up saying "You are not qualified to use this coupon".

So it looks like it detects that I am using Temu on a rooted phone or emulator (as I tried it before with Bluestacks). I am using Magisk for root and tried to use different modules such as Shamiko, Zygisk LSPosed, HideMyAppList, passing SafetyNet. I added the Temu to the DenyList in Magisk. When I test it with a root checker, it works fine. But Temu still detects that I am using a rooted phone.

Does anyone know how I can hide the root? Thank you very much!
