Thread: [\[FREE SCRIPT\] Email Bomber by Horus Strike](#)

Horus Strike - November 6, 2024, 9:03 am

Hello everyone! ?

Today, I'm excited to share a Mail Bomber tool I've recently developed using HTML, CSS, and PHP.

System Requirements:

To use this tool, your server or host needs to have the "mail" function enabled (most hosts support this by default).

Key Features:

Automatic generation of a random sender email.

Choice of target recipient.

Option to specify the number of emails to send.

Customizable email subject.

Personalizable message content.

ScreenShot :

How to Get Started:

Simply unzip the file on your web host or server, and it's ready to use!

? I'd love to hear your feedback if you find this tool helpful. ?

Note:

While this tool may not be the most optimized version out there, I'm making it available to assist those searching for a reliable solution.

It's a simple but effective tool that can be beneficial for many. ?

The link has been updated.

Thanks you the reply ?

I just updated again my post, I'm giving away this little script for free to the community of HF ?

hackermenace247 - November 9, 2024, 8:29 pm

Thank you so much I tested it on my personal email. I'm gonna try to move it up a notch to send the email bomb to Jeff bezos

Yes this script still works, however you should configure your server first.

SuperAI - November 14, 2024, 8:33 pm

Do I deploy this as if I were building a URL?

Yoshimitzu - November 15, 2024, 12:39 am

You deploy it by uploading the files to the server, and it is done (ofc configure the mail server, but that is self-explanatory).

Kids these days lol, can not even understand the normal old-school way to do the simplest form of website setup :D
