Thread: [PageKite works with Quasar?](#)

Inversin - November 10, 2024, 8:40 pm

Hello!

Does PageKite work with Quasar RAT?

That is because i have heard of PageKite and my Router doesn't support port forwarding, so i want to know if PageKite works with Quasar RAT or AsyncRAT.

Thank you if you can answer me.

Hreidmar - November 11, 2024, 4:53 am

What router do you have that doesn't support PF??

I can't imagine why it wouldn't work but using RAT over such services will most likely get your account banned eventually just like someone recently using portmap.io to do this then his account got banned.

Your next best thing is to either find a VPN that allows port forwarding and doesn't store logs (quite hard) or even better buy a BULLETPROOF VPS (you can check some under Market->Hosting Services on this forum) and maybe buy yourself a domain as well so if you ever stop paying or hosting stops operating you still have domain that acts like Dynamic DNS so you won't lose your clients.

Why in the flying fuck are people still hosting shitware from their home internet?

At the very least, get a cheap shit VPS for ~£5 and host it from that.

Because they weren't here 10 years ago when Blackshades and other sold RAT owners and some users got busted.

They don't realize that if you use RATs for malicious intent that you absolutely can get in trouble big time.

I agree, some still don't realise using malware can get them in big trouble, hence I'm telling them it's

stupid to do it on their home internet.

I can't port forward because of CGNAT.

But there is a free reverse tunneling service? (im broke, my debit card has less than a dollar)

I have heard of tailscale port forwarding too, but i don't know if it can work with Quasar.

Also i heard of AWS.

There absolutely are free options but you not getting eventually banned the chances are quite slim especially if you try to do that with one of the biggest company in the world called Amazon (AWS)....you going to get your account banned and perhaps even your address blacklisted.

I assume you're using mobile data considering you're on CGNAT I also don't recommend risking getting into troubles with your carrier because they might detect malicious activity.

You're free to do whatever just don't be surprised if things go bad.

Is there a way to make the Tunnel locally or is an external service required?

"Making a tunnel locally" would be totally pointless.
