Thread: [Website cloned in simple html,css and JS](#)

linkman46 - November 19, 2024, 5:08 am

Need a website and its subpages cloned with simple html css js, basic functions should work but of course dynamic things like graphs can be just static versions of it.

This should be clean code most of all which has just native HTML,CSS,JS no NextJs or any like it. Looking for someone who is good enough to do it and does not use a free website ripper because these do not work here

Hi mate, there are plenty of websites that offer landing pages (also with subpages like Home, Contact ...). You just need to pick one, change the images and text, and that's it! After that, create a .zip file, upload it to your domain, and unzip it.

If you want to create a subdomain, you can do so easily through your hosting control panel. If you need more help, feel free to PM me, and I'll do my best to assist you. I can also share some YouTube videos for guidance, but it's really simple!?
