Thread: [How to Exploit vulner CVE-2023-28450 and CVE-2023-50387](#)

Helpedyousleep - November 30, 2024, 8:10 am

I was running tests on a Wi-Fi when I discovered some vulnerabilities with nmap.

Vulnerabilities are: CVE-2023-28450 and CVE-2023-50387. 3 Exploits can be used with these vulners according to nmap, BB688FBF-CEE2-5DD1-8561-8F76501DE2D4, 79068BEF-A572-5A8A-88D0-177524BDAAFE, and 5EFDF373-FBD1-5C09-A612-00ADBFE574CF. Are these major vulnerabilities? How can I exploit these vulnerabilities? **Consent Given**

Links if needed:

Vulner#1 [vulners.com/cve/CVE-2023-50387](#)

Vulner#2 [vulners.com/cve/CVE-2023-28450](#)

All help is appreciated ??

Vulnerabilities for what? You must still be at the script kiddie stage if you think that you can do something here. The first one is a DoS vulnerability in DNSSEC. The second is a vulnerability to UDP Fragmentation attacks. Neither have any relation to RCE.

Is this actually wireless-related?

Will do. I was wondering what exactly the vulnerabilities were. And no, wrong forum.
