Thread: [Pc wont boot with RTX 3060](#)

Skidsuper - December 16, 2024, 7:20 am

I am using a cheiftec 750C powersupply which should have more then enough power. When I swap with my older amd gpu it runs ok. But when I use that gpu and use both 8 and 6 pin it wont boot. There is a click and thats it, wont even go to BIOS.

That doesn't sound like a power issue. Maybe the 3060 is defective? Or the PSU doesn't like the 6 pin being plugged in, which doesn't sound very likely.

Mooooookie - December 16, 2024, 12:01 pm

Sounds more like a hardware conflict, or resource conflict then an issue with the power supply.

Biggy_Asian - December 19, 2024, 7:25 pm

This is why you should research if your parts are compatible and upgrade ACCORDINGLY. Its not hard to use fucking google bro.

SIM-2502833 - December 19, 2024, 7:33 pm

Could be a BIOS setting if its set to run on older PCIE versions or you have a riser cable.

F4tDoinkz - December 19, 2024, 7:49 pm

Sounds to me either a bios issue which I think is unlikely, or a defective GPU which is possible.

I took it to a repair center, they diagnosed one of the power cable is faulty. After fixing it works fine now. Running small llms and diffusion models. Need upgrade to a better graphics card though.
