Thread: [Monitor mode on VMplayer using kali](#)

Valdoka - December 21, 2024, 12:57 pm

Hello;

i am having a problem enabling monitor mode on a virtual machine that use kali.

With a wifi adaptor Realtek RTL8812AU

the point is, that i cannot see anything when a type ifconfig or iwconfig

the installation that i made it, is this:

On VMPlayer i enabled it the usb3.1

apt-get update

apt-get install realtek-rtl88xxau-dkms

maybe is something that i can do with airmmon-ng?

Run lsusb but I can guarantee you that the adapter will not show up. You must have configured USB passthrough incorrectly. If not that then the kernel module did not get installed correctly. Yes, you can install drivers for Realtek wifi adapters, but because they're out of band, it tends to be a headache. I would always recommend Mediatek or Intel over Realtek for this reason.

Yep, not hard. Let me know if you have trouble capturing.
