Thread: [.net app obfuscated by SmartAssembly 6.10](#)

**tester34122** - December 23, 2024, 5:46 am

I have a case of an app [game bot] obfuscated by SmartAssembly 6.10.0.218. The app target framework is .NETFramework,Version=v4.6.1. It crashes when I try to attach debuggers. I'm trying to find a way to:

- a) [the best case] decompile it's code, so I can read and learn as it's interesting case for me;
- b) learn how to edit it to avoid the logging/license checking;

Does anyone have any ideas? I tried with de4dot from some github fork and it says it completed (the .exe size went from 171,407kb to 1,222kb) but while checking the output exe with dnSpy, most methods are marked as "extern" and there's almost no code inside.

I'm new here, so I don't know who he is, but he's a gr8 haxx00r then. Hopefully, he will be able to help.

Can you send me the executable? I'll have a look and tell you what I did, if anything.
