Thread: [got access to complte sensitive data](#)

knightlearn - January 5, 2025, 12:48 am

Hi guys so first of all i got some sensitive data from a website like api key, database host username password, razorpay data, aws bucket sensitive info.. all these due to a bug(Class App\Http\Controllers\Web\RegistrationsController does not exist).

In that bug there was also this info on ui of website

```
/var/www/html/WebsiteNamewasHere/vendor/laravel/framework/src/Illuminate/Container/Container.php
}
```

```
/**
```

```
    Instantiate a concrete instance of the given type.
```

```
    @param string $concrete
```

```
    @return mixed
```

```
    @throws \Illuminate\Contracts\Container\BindingResolutionException
```

```
*/
```

```
public function build($concrete)
```

```
{
```

```
    // If the concrete type is actually a Closure, we will just execute it and
```

```
    // hand back the results of the functions, which allows functions to be
```

```
    // used as resolvers for more fine-tuned resolution of these objects.
```

```
    if ($concrete instanceof Closure) {
```

```
        return $concrete($this, $this->getLastParameterOverride());
```

```
    }
```

```
    $reflector = new ReflectionClass($concrete);
```

```
    // If the type is not instantiable, the developer is attempting to resolve
```

```
    // an abstract type such as an Interface or Abstract Class and there is
```

```
    // no binding registered for the abstractions so we need to bail out.
```

```
    if (! $reflector->isInstantiable()) {
```

```
        return $this->notInstantiable($concrete);
```

```
    }
```

```
    $this->buildStack[] = $concrete;
```

```
    $constructor = $reflector->getConstructor();
```

```
    // If there are no constructors, that means there are no dependencies then
```

```
    // we can just resolve the instances of the objects right away, without
```

```
    // resolving any other types or dependencies out of these containers.
```

```
if (is_null($constructor)) {  
    array_pop($this->buildStack);  
  
    return new $concrete;  
}
```

Arguments

"Class App\Http\Controllers\Web\RegistrationsController does not exist"

How should i fix it?
