Thread: [Aymyth doesn't work in a good way](#)

**AnonUserBB** - January 8, 2025, 7:13 am

Im making proves infecting a virtual machine of android with a payload generated with ahmyth RAT and its working bad, because when I use Boot Method with a bind app it doesn't open right, it open for like 3 seconds and then it close, in a real scenario when a person see that the app that is downloading doesn't work is going to uninstall the app.

So, how I do it to infect the app and when the app gets open doesn't get closed in seconds?

And when I use the Activity method is not working, it doesn't get the app to get closed but I don't have connection with the infected device.

I don't know what actually do to solve this problem, if someone have a solution please tell me

Issue Fixed! ---->

ahmyth have a problem binding applications that are higher than Android 6, so if you bind an application lower than Android 6 seems to work perfectly

Sorry for the error of naming the post "aymyth" instead of ahmyth.

Have a good day!?

Android 14 still supports API Level 23, but you can expect issues, even with crypto. Storage access and battery optimization are two that come to mind.
