Thread: [RAT Portfoward/portmap alternative](#)

SIM-5607522 - January 8, 2025, 2:01 pm

I have Xworm rat all set up and works very well with a dropper but I have one small issue. I get my account banned on portmap and there is no chance I can port forward with my ISP (long story). I know about VPS (AnonRDP) and how it is an option but I am saving that solution for last. Any suggestions to alternatives? I do not want to use a VPN with port forwarding as the only one I trust (mulvad) does not support port forwarding.

Buy a VPS, RDP, or similar and host it there

SIM-5607522 - January 8, 2025, 2:08 pm

I was planning on using VPS, just seeing if there was something I didn't know about. Sorry if I look like a bit of a noob.

SIM-5607522 - January 8, 2025, 2:09 pm

I was mostly hosting on network for testing and not real world use.

ah it's alright, everyone has to start somewhere.

I think what people are saying though is basically that you should stop and learn about how to do what you want to do safely, securely, and anonymously - before continuing.

The thing with VPNs and other services is that a lot of times, they are not actually fully anonymous. You'll want to look into bulletproof servers, offshore - probably.

That makes sense, but still be careful. Sometimes just having a software can be bad enough, even if you never use it.

What [Hackers](#) is trying to say is that you've boxed yourself into a corner. Openport.io might work for you, but you're trying to do bad things on the cheap.

Is it safe for VPS to build a TCP agent and assume that the server is local?

Lbawye - January 30, 2025, 3:48 am

I would recommend using OpenVPN, i used to use it. Free and all of that, no ports on my network were forwarded plus the RAT was hosted on a VM. If you are going to host it on your home network, make sure you do not use your home IP and you use the VPN and it will listen through that. Also ontop of that make damn sure you obfuscate the built RAT, just to make it all that much harder to identify.

fscammers - *January 30, 2025, 9:21 am*

playit.gg does it automatically, but they will ban you for hosting malware. accounts are free and you can use temp emails to create new accounts.

kentsutcliffe - *February 3, 2025, 9:14 am*

do not host on your home network
