Thread: [Need Help with DNS and Port when building rat](#)

Looking4Rat - January 16, 2025, 7:29 pm

hey complete skid here. building my first rat and have some questions about how to build it.

I am using two rdps to test the rat on one is the victim rdp and one is the host rdp.

If i build the rat just complete default setting not doing a anything i can run the rat on my host rdp and it works fine however when i try to run it on the victim rdp it wont show in my list of connections

I assume this issue has something to do with the DNS and port for when i build the rat. What are these variables and how do I found what im supposed to put there?

also whenever i first open the host program it ask for a port or a list of ports. what exactly am i supposed to put there and how do i find it?

kind regards to whoever can help me out with my problem?

i cant provide example images since my account is new but if anyone needs them i try to provide them some other way

AysncRat but I might plan on trying some others

im a little confused what exactly you mean by "open up the port"

BikerDude - January 16, 2025, 11:40 pm

can someone explain me whats RAT and how do you make money with that?

(Jan 16, 2025 08:54 PM)Caboose Wrote: [\[CITE\]](#) on your windows go to control panel>System and Security> Windows defender Firewall then on the left hand side you'll see Advanced settings. Add the port there on the rules page.

I also suggest Dark Vision Rat it's great for the price

He doesn't even need to do this alternatively he can go through his ISP gateway address if he is running it on his own machine but this option works as well because you will need to do this either way

Try to check if the port is open at your modem settings
