Thread: [Screen Recording within Rat](#)

Swench - February 7, 2025, 8:06 am

Hi, I'm not sure this is possible but;

I am looking for a way that allows me to start screen recording everytime a user opens a specific website, must be hidden too i.e no "screen recording started" notifications...

Is there anything like this available?

I cry blood - February 7, 2025, 1:38 pm

Available? Not to my knowledge, no. However, making such a program and dropping it on the machine manually wouldn't be that difficult.

You can scan the list of system processes and look for a browser session (chrome.exe, firefox.exe, etc). Then you can load user32.dll to capture the current window title the user is interacting with. That dll has a function called GetForegroundWindow. You can capture the handle of the current window and then use GetWindowText to capture the title. At that point, you compare the current title to the title of the website you're looking for. And once there is a match, you began taking screen grabs. The FPS may not be so good, but idk what kind of quality you're looking for.

Use DirectX to record a screen at a frame rate of 60 frames per second, and you can save a video file directly

Still looking... maybe some sort of screenshot taker when a certain website is opened...

patchdev - September 5, 2025, 3:55 pm

nah this would be insanity, and wtf u tryna do

It has to be manually done. It can not be automatic.

incogpryody - September 7, 2025, 9:54 pm

Manual coding would be needed for this
