Thread: [Disconnecting devices from a network](#)

w3b_man - February 18, 2025, 9:57 am

I recently learnt how to kick all devices from a network using aircgeddon, is it possible to deauth certain devices on a network?

Rogers Communications - February 18, 2025, 10:59 am

I believe most newer routers won't allow deauth's anymore.. my experience anyways

This is mostly true but some devices mostly cheap IoT devices have bad implementation with FMP (Firmware Management Protection) and in most of cases 1 device connection under such policies kill the usefulness of it

I know at least one of the routers I have allows deauths

I don't believe routers have a say.

aireplay-ng and MDK4 both support specifying certain stations. Like, the applications that the aircgeddon script uses.

Ok thank you, I will look into this. Do you know the rough command I would need to use in Kali

Easy to look up. Just run 'sudo mdk4 wlan0mon d -c [channel] -S [station MAC]'

Sparton - February 18, 2025, 8:22 pm

That is assuming your wifi adapter is wlan0. It could easily be wlan1, wlan2, etc. Depends if there are other adapters connected in your computer. Check with "airmon-ng" first to view the assignments.

Then of course you have to start the adapter and do a "check kill".
