Thread: [\[MRT-X\] HackForums Download Link Safety Check Database](#)

Tha Sneak - February 20, 2025, 7:56 pm

? Malware Analysis for HackForums Download Links

This initiative is dedicated to analyzing download links and files posted on HackForums to ensure they are free of malware. This includes both new and old threads.

If you come across an old thread that you would like to analyze, please do so. If the file is found to be infected, we will properly inform the staff members.

? Posting Format

Please use the following format when submitting an analysis:

Code - [Thread Link] | [Download Link] | [Safe/Infected/Needs Further Review]

If a file requires further review, send me a private message (PM) with the format above, and I will conduct a detailed analysis.

? Future Database & Master Thread

I will be creating a database to store these reports in the future, but for now, we will maintain a master thread for tracking analysis results.

? Important Considerations for Analysis

? Simply uploading the file to VirusTotal is NOT enough.

- Many online scanners can produce false positives or miss advanced malware techniques.

? Real malware analysis involves executing the file in a controlled environment.

- This can be done using:
 - A dedicated malware analysis machine
 - A virtual machine (VM)
 - A sandbox environment

? Be aware of advanced evasion techniques

- Some malware may include:
 - Anti-VM (detects if it's running inside a virtual machine)
 - Anti-Debugger (prevents reverse engineering)
 - Anti-Decompiler (obfuscates code to prevent analysis)

- Anti-Sandbox (detects and bypasses sandbox environments)

If you need any help whatsoever, please send me a PM. This is a large-scale project that will take considerable time, but it is our responsibility to ensure it is done properly and accurately.

Thank you for contributing to keeping the community safe! ?
