Thread: [Python name grabber and renamer for spreading](#)

danielgomesb - February 27, 2025, 4:40 pm

Here are two scripts in python to make it easier for you guys spread your payloads.

Inside the zip there are two files.

Leecher.py - scrapes 150 pages of each category of 1377x dot to and saves to a txt file inside same folder of the script

The txt file will contain like 16k download links like in the format below

/Torrent/123456789/cracked-software-name

What I do is replace all hyfens with a space and replace all slashes with a comma using notepad or notepad++ then I save as CSV file, import it to sheets dot Google dot com and copy the column with the files names and paste this result inside the generated txt file of scraped links

Second file "renamer.py" it takes the file that has the name file.exe inside same folder of the script and creates one copy for every name you have on the previously created name list, it will save renamed copies of file.exe to a folder named out inside same folder of the script.

I hope you enjoy my first contribution in years using HF.

PS.: you can rename whatever file type you want, just need to change the script behaviour of renamer.py

I made this but couldn't successfully spread using apexdc and similar programs. Do you have any tips?
