Thread: [HOW TO ICLOUD BYPASS NOOB FRIENDLY METHOD 2025](#)

okub - March 11, 2025, 11:39 am

1. Place the target phone in front of a good-quality camera and start recording (DLSR cameras are preferred).
2. Reboot your icloud locked phone three times (just to be sure).
3. Play the camera footage in slow motion and write down the icloud email. (When you reboot the phone and the screen turns on you will be able to see the typical iphone lockscreen for a split second. In the lockscreen notifications there will be a notification by icloud saying that the phone has been icloud locked by e-mail x.)
4. After you capture the e-mail carry out your OSINT analysis and through the means (I prefer Social Engineering by far) of your choice acquire the passcode for the icloud account.
5. Plug in the phone in a VM, connect it with Windows iCloud client and reset it.
6. Log in to the icloud account from a secure connection and simply unlock the phone from there.
7. Now that it is no longer iCloud locked and you know the passcode simply setup the new phone.
8. We are almost done. JailBreak the iphone and through cydia install the package meant to change the IMEI of the phone.
9. Once the IMEI has been changed you are free to use your new phone! (I would personally completely change the IMEI chip of the phone its self but whatever you want)

So how does one log into an iCloud account while knowing only a passcode? And how does one replace an internal soldered chip?
