Thread: [Cyber Hunter 2.0: Help Build an Autonomous Vulnerability Scanner](#)

Ulyanovsk - April 6, 2025, 7:09 am

Hey tech folks, cyber warriors, and code magicians!

I'm working on a next-gen network scanner project, inspired by the Blob ? — a fully autonomous entity that moves through networks, identifies known and unknown vulnerabilities, adapts, and explores stealthily.

? Project Highlights:

- Maximum stealth (anti-detection by design)

- Intelligent vulnerability detection (AI/ML-powered)

- Deep scanning (OS, installed software, misconfigurations)

- Automated exploitation of discovered vulnerabilities

- Report export (HTML, CSV, email)

- Propagation via SSH, SMB, and more

- Real-time vulnerability feeds (.csv.gz -> SQLite -> PKL)

? Looking for: Dev or security enthusiasts who are:

- Into Python, networking, cybersecurity, AI/ML, or low-level system dev

- Curious, creative, and want to push boundaries

- Down to build something badass — maybe open source, maybe monetized later

? I've already built scripts to pull and store vulns, laid out the network scanner's base, and started work on the AI part — but I'm looking for real partners to take this further.

? Want to help build an autonomous, intelligent scanner that gives Nmap a run for its money? Let's talk.

? DM me or drop a comment if you're interested. Let's build the brain of the network.

Robert Rouge - April 6, 2025, 7:12 am

seems like a cool project. jeep us updated

Ulyanovsk - April 6, 2025, 7:33 am

The first version almost fonctionnal

Bastille - April 6, 2025, 9:54 am

Sounds to be an interesting project, good luck with it !

Hello OP. I am interested in your venture.

Ivanov_1 - April 6, 2025, 10:09 am

Looks very promising and i look forward for updates.

7 - April 6, 2025, 10:20 am

Interesting. Lets see some working demos.

I personally am working on something similar but for recon and OSint.

Which autospiders via API (snusbase, intelx, dehashed, ipinfo, reverse image, facial recognition match and others..), saves to database

It can reverse images, facial match profile pictures and message the target to try to obtain the AMSI.

It can be singular input such a username, IP, email or even a photo...

It then outputs to the database and score the likeliness and also outputs to maltego graph.

I am interested to see your product pan out.

TFUEIDO - April 6, 2025, 10:23 am

Seems cool, can't wait to see it

Let's build the brain of the network.
Sounds like a promise.
I am ineterested in joining this venture.
I am also a dev. Please dm me

Hamedmusa - *December 23, 2025, 7:01 pm*

I Will like to buy you tools please how much is it
