Thread: [Orcus RAT 1.9.1 + 13](#)

ZrNoxb - April 7, 2025, 11:10 am

Before you download it, check this:

I haven't taken the time to check for backdoors or anything, so I used it in a virtual machine. If anyone offers to check the file for viruses, that would be a great help.

You are responsible for the actions you take with this.

? Main Features of Orcus RAT

Full Remote Access

Total control of the infected computer (as if the attacker were physically present).

Support for encrypted connections (TLS) to evade detection.

Spying Features

Keylogging: Records everything the victim types (passwords, chats, etc.).

Screen Capture: Real-time screenshots.

Webcam/Mic Activation: Records audio and video without permission.

Information Theft

Extracts credentials saved in browsers (Chrome, Firefox, Edge).

Searches for sensitive files (documents, databases, cryptocurrency wallets).

Advanced Malicious Features

DDoS: Can turn the computer into a "bot" for denial-of-service attacks.

Download/execute other malware: Such as ransomware or cryptocurrency miners.

File Manipulation: Delete, encrypt, or upload data to the attacker.

Plugin Support

Cybercriminals can add custom modules (e.g., additional ransomware).

I really like this mouse, but it was discontinued a while ago. The antivirus detects it. You would have to use another tool to bypass the antivirus.

I think MRT-X should look at this.

I would if I had time but you know too busy these days with cyberint.

I would prefer the whole clean source. I think I could do magic in memory of Armada

Don't worry if you're busy, it's okay, Let's see if anyone can look at it.

Why not just post the source code that's on Github?

BTMOB - April 7, 2025, 1:21 pm

new account without source code on Github let us wait staff check it

ZrNoxb - April 7, 2025, 1:40 pm

What are you talking about?

(Apr 7, 2025 01:02 PM)Ethan Wong Wrote: [\[CITE\]](#) Why not just post the source code that's on Github?

Here it is already compiled
