Thread: [Looking for Plugins for Winos 4.0: AV Killer + Persistence Driver \(Win 10/11/Server 2](#)

**david28** - April 19, 2025, 10:23 am

Hello HackForums community,

I'm looking for a skilled developer to create two plugins for my Winos 4.0 controller. Here are the details:

Plugin 1: AV Killer

A plugin to disable/kill major antivirus software, including but not limited to 360 Total Security, Avira (Little Red Umbrella), and Microsoft Defender.

It should ensure the AV is fully disabled to allow my controller to operate undetected.

Must remain FUD (Fully Undetectable) against these AVs.

Plugin 2: Persistence Driver

A driver to ensure persistence and privilege maintenance on infected machines.

After a reboot, the machine should automatically reconnect to my controller.

It should gain at least mid-level privileges (e.g., SYSTEM or admin-level access).

The driver should operate at the kernel level and remain stealthy.

Compatibility: Both plugins must work on mainstream Windows platforms, including Windows 10, Windows 11, and Windows Server 2016 or higher (x64).

Stability: The plugins should be stable, with minimal crashes or system instability.

Additional Info:

I already have a working Winos 4.0 controller, but it lacks these features.

Budget: Willing to pay a fair price for quality work (please provide your quote).

Payment: I can pay via cryptocurrency (BTC, Monero, or USDT).

Contact: Please PM me or reply to this thread with your experience, timeline, and quote. I'm also available on Telegram for further discussion (PM me for my ID).

Looking forward to working with a talented developer!

If you're offering money for work it has to be under Market tab.
